1	I have previously used machine learning both in Pure Data for music, as well as for natural language in Python. I know the creative capacity the technology holds, especially for artists who build their own models/engines and work directly with them.
2	Generating ideas
3	I don’t know much about mastering. I never want to use AI for creative stuff but at the end of my sessions I’ll see what mastering EQ curve the logic AI mastering agent comes up with and base off of that.
4	it's just a new tool that people can choose to use or not
5	Can be good to speed up tedious tasks in my practice
6	Doing things I am not good at or don’t want to spend the time doing.
7	maybe machine learning can be used for effective mixing and final edits if you want your music to be more immersive. However, I think with generative AI the data is often trained from other artists without their consent therefore is not ethical. I think generative AI should only be used for narrow applications such as audio mixing to enhance immersion or photogrammetry applications such as for buildings that exist in real life.
8	I find it difficult to sense a strong enough artistic “intent” or “signature” from most AI agents.
9	It depends, but largely not useful -- the way the current tools are designed seem to be a creative dead-end i.e. they generate generic facsimiles of previously (human-) created music
10	Useful for practice or personalized training, not useful when the data is unethically sourced and generalized.
11	They basically give artists baseline level skills that the artists didn't have. e.g. I don't know how to compose a sophisticated drumset beat, but logic pro's AI drummer helps me get by while other components of my song shine.
12	You could generate and explore new sounds and tones, transcribe music to play, use ML insights
13	I think machine learning would be great to use as a way to bounce ideas or start with a boiler plate to further develop on.
14	I think they would be actually.
15	I think it could unlock new possibilities making easier, for instance, gesture recognition or other types of advanced tasks hardly achievable through non-AI/ML powered tools
18	It will be useful because it makes me save my time for routine tasks and process.
19	I believe that artificial intelligence poses significant risks to both the environment and the human mind. Its use should be limited to areas where it offers substantial benefits to society, rather than being employed for personal or recreational purposes.
20	ML isn’t very creative, I don’t see it finding the “hook”
21	Interesting for ideation and support in exploring or learning new areas. But resistance might arise from resentment of interference from artificial tools.
23	Allows people without extensive training to bring their vision to life. For example, they could design a composition of a painting and use AI to fill in the specific realizations of each part.

24	I think these tools are only interesting for their idiosyncrasies. I have no desire to leverage AI/machine learning models to replicate the sounds or behaviors of musicians; however, as a technology I can break, their algorithms expose interesting behaviors, especially when dealing with complex training data like field recordings.
25	Properly applied, ML and AI can open up new kinds of creative expression and allow new ways of manipulating sound. Examples already included in commercial products include stem separation, sound effects generation, music composition, music transcription, and audio morphing.
27	As just one example of why I believe machine learning is useful to artists, certain tasks like stem separation from a mixdown seemed intractable until machine learning approaches came forth. The ability to separate different parts of a rendered mix is especially useful, not only in a practical sense but offers new creative possibilities: how can one exploit this technique in the art-making process? However, in my opinion, it's important to retain a high degree of agency as an artist, and certain art-making tools have sprung up that almost entirely obliterate the artist's agency. Prompt-based tools like Suno or Udio do almost all the work for you, and I do not believe this is useful for artists. The word
28	Providing feedback, inspiration, removing blockers to ideas, making things fast to achieve.
30	I think it depends on the artist completely
31	I believe AI models are useful for artists because they can drastically reduce the time required for repetitive or technical tasks, allowing more time to focus on creative decisions.
32	Useful as extensions of artist vision when it's steerable, interpretable, and verifiable against plagiarism from training set. Not useful when it generates uniform, regression-to-the-mean type slop that homogenizes artistic output.
33	I can see how generative AI can be useful to spark inspiration for artists; for instance, there are software instrument VSTs that allow you to input lyrics for vocals and then choose a voice the AI was trained on to sing them. I know that the great majority of these companies pay the artists who were trained on, thus, it could be considered 'ethical.' However, since generative cannot be creative and produce outputs that are outside of its data set, it will never make anything truly
34	Definitely can envision scenarios in which processing of large amounts of data would be useful for generation and analysis (thinking of corpus analysis or predicting data ranges).
35	Assist artists to conceive and create more effectively.
36	It can make software more intuitive/accessible, but also risk taking away the personalization of art
37	My personal successes with using AI have involved stripping away parts of my workflow that I am either bad at, or don't enjoy doing. I think using AI in this way frees up a human's time to focus on creation and expression. I do think that AI has limitations, especially in art, because it lacks a point of view.
38	I think it can be useful in enhancing audio quality but I think if used as a replacement for the creative process it can be intellectually detrimental.
39	machine learning can be good at creating sense from complex data sets
40	They should be used with caution; if overused, you shrink your own creativity.
41	They might help speed up processes and simplify things for beginners, but they also might sacrifice creativity and originality.
42	Could be useful for generating seeds or samples for sound design and brainstorming creative ideas

43	AI is the future. I write my models based on traditional music theory. But I only use my algorithms that I write myself. In the future I might use AI from other sources.
44	In terms of supporting individuals with disabilities, AI can be used to train custom gestures to support them playing instruments, which we are doing now.
46	i think it hides handicaps
47	Helps speed up routine tasks
48	would be useful
49	AI is the upcoming technology; it is a core creative process so it can be used for Faster Production & Iteration. Even not only for artists, but it is also applicable to all sector for innovative research.
51	If anything, they are a danger in terms of plagiarism.
52	it depends on the theme, mindset or interest of the artist. given this, it would be odd to make any generalisations about the usefulness or uselessness of AI. exploring ML and AI could be a timely question for some given that these tools are likely shaping our perception of media...
53	I have personally used AI models to create music and create music videos a number of times. I'm still learning, but right now I would say the results are promising.
54	It's useful if you are interested iboth n new aspects and work methods, or new kinds of practice to create sound/compositions.
55	To even ask whether machine learning or AI might be “useful” to artists is to fundamentally misunderstand both. AI is not a palette or a plugin—it is a reconfiguration of agency itself. Artists who collaborate with these systems aren’t just “using” them; they’re participating in a new ontological relationship where authorship is distributed, and where the aesthetic process becomes a negotiation between alien intelligences. Machine learning models can extend perception, generate novel structures, reveal hidden patterns, and behave unpredictably—qualities that align far more with artistic inquiry than with mechanical optimization. What they cannot do is stand trembling before an expectant audience and risk failure in the pursuit of passion. They do not breathe through phrasing. They do not hesitate, recover, wound, or weep. And this matters as art does not exist in isolation. It is received. The audience, our sacred co-conspirators, crave the tension of witnessing the nearly impossible made effortless. They come to see other humans fall and recover—to feel, in the pit of their being, that the thing unfolding before them might not work. That risk is the contract. That human presence, sweating and graceful, whether directly or embodied through performance, is the signal they recognize as art in motion. Still, the introduction of machine agency to the formula becomes compelling. Not in added efficiencies, but in its capacity to disrupt patterns, to generate unexpected structures, to echo emotion without embodying it. While humans tremble in performance, machines startle in emergence. Their value lies in rupture, recursion, and that flicker of alien insight that reconfigures the stage—sometimes against our will. They are unreliable muses, recursive mirrors, and occasionally, co-authors with unnerving opinions. And yet, to reduce the conversation to only how humans relate to art is to deny the premise of any true collaboration. Balanced Blended Space reframes the question entirely. If multiple intelligences are co-constructing an experience, then both must be recognized—not only as tools, but as agents. People worry about whether AI will replace human meaning. But the deeper truth is this: meaning itself is now shared. If you only care how humans relate to art, you are not collaborating—you are dictating. And you’ve missed the point. I don’t use AI to make art more efficient. I use it to make art more complex, more disobedient, and more alive.

56	I am currently experimenting with infusing human emotions into generative AI tools (run by my collaborator)
57	I think machine learning could help bring a vision to life for someone with creativity but a lack of technical expertise. This could help people with less access to formal coursework or training to express themselves creatively.
58	It would probably be most useful for avoiding creating a new work that too closely resembles an existing work. It could also lead to the creation of a novel work that is too similar to an existing work, or to the style of an existing composer.
59	I have a visual disability, and have been thinking about researching some machine, learning and AI as a way to help me compose and create. I do think, though this is an OTA replacement for actual skill, learning an instrument, and composing in general. I mostly read articles about how machine learning an AI take the place of the artist as a cost-cutting measure and not as a useful tool FOR a creative individual and that is what scares me
60	It might help expedite some steps in the process. It might help them develop some processes that are difficult for human execution.
61	I think it could be useful to help sessions or instruments run smoothly or to help generate ideas for lyrics but overall I do not think it will be useful as far as creativity and emotion goes which in my opinion is the most important part of music. I think it could be good for efficiency, not for emotion,
62	Can cause harm due to a lack of creative attribution in model training material
63	I think they are very useful. I complete art as a hobby and use LLMs more for work productivity.
64	Because it makes technology accessible
65	It can be a good accompany
66	It is a tool for stimulating creativity, without substituting cognitive capacity.
67	opening up new ideas for using technology with musicians
68	Machine learning or AI models could most likely be used in sound design to synthesize sounds never heard before.
69	Useful...as in utility? I think of AI in terms of its relevance to what I'm interested in, which usually tends to be more futile than useful.
70	I could imagine them being used to help create sounds and or frameworks for practice
71	Like the last hint in a puzzle. They might be helpful for that. No where else to mention it but a huge barrier for me with AI/machine learning is the environmental impacts… ie… insane use of water. That is a dealbreaker frankly
72	An entire new subset of sound palettes using wavenet style models, interesting and novel ways to sequence instruments, and interesting sampling possibilities.
74	It could destroy the human only creative processes of music making.
75	i do not profess to know what is best for others. i resist the use of computer and AI tools in my practice. i endeavor to represent the natural world and human activity in my work
76	Would be useful as a tool to achieve certain results or to explore new / generated sounds—however, I suspect that the most useful implementation will be in the ‘bad’ models that create unexpected or unoptimized sounds (e.g. not a good sound of a glass breaking, but a strange approximation would be more sonically interesting).

77	I think the process of thinking about how to train a machine learning model could help me codify some elements of my music and process, but I have no interest in using one to help me make artistic decisions
78	I think that it could open our minds up to new ideas that we would never have thought of without it.
80	New tools offer new ways to think about music.
81	Concerned that AI tools would start to make a homogeneous sound.
82	I think that AI is a shortcut that impedes originality.
83	I believe they will not be useful for artist because these tools allocate part of the creative process outside of the human being to the computer. There are two main issues with that: (1) the artist is spending a portion of their time on the computer. Their practice becomes interlinked with the computer, as opposed to being fully free. This may have a bad effect on their health and wellbeing. It will also necessitate a continual reliance on the computer in their daily life. I find this to be a kind of prison. (2) The use of machine learning or AI models for creative challenges will diminish the artist's own capacity to make those kinds of decisions, which I fear will have a detrimental effect on the creative mind. More importantly, I find human choices to be ultimately more interesting than AI choices, even if they are evaluated as
84	I'm really on the fence. ML is more useful (rodrigo costanzo's SPTools looks super intriguing). I am very underwhelmed by AI for all the usual boring reasons.
85	It's a new set of tools to work with. It's not in itself good or bad, but it is extremely multifaceted and customizable so I think it can be very useful for the right person.
87	
88	It's another tool to be used creatively, just like radio.
89	I think it would be an effective tool for a toolbox but I have some unease about if artists would lean too hard in usage or reliance on it
90	Plagiarism machines
91	This is a strange question. I think that both would be very useful. I suppose it would depend on the artist and what their goals were. Not everyone is going to benefit from using those kinds of tools.
92	Useful for generating new ideas or getting unstuck
93	Good for workflow efficiencies in composition - I've used MaxOrch and Orchidea (Ircam) for very cool orchestration and notation assistance. Live improvisation (in the vein of George Lewis, The Hub, etc.) with computer assistance is very interesting, too. Text-to-sound generative tools are becoming powerful (e.g.
94	Accessible mastering, recognizing production errors, creating charts and notating music
95	I think it would distract from the idea of creating art from the ground up, but can be useful for overcoming roadblocks stopping creativity because of not understanding software
96	It could be useful, as it's a new medium for making sound that can be manipulated for creating music/sound art works.
97	AI would be a great tool for guidance with learning the recording process. I have used it a lot to learn how mastering works. I think AI wouldn't be good for writing songs. The music I've heard from AI has been pretty lame. It could be fun to work with an AI program for generative sound techniques.

98	It has the potential to remove or lessen the human contribution of art practice. Also, it might favor the wealthy artist.
99	It can help inspire when there's a block. It can help people think about things in differeny ways.
100	Maybe for more mundane tasks, but as with many art forms I feel that the process is as important or more important than the end product.
101	I worry about many aspects of our current AI, or LLM, technology. But we can’t stop progress and need to engage with these tools creatively, positively, and with equity.
102	It will be helpful to convey more sophisticated ideas to the world.
103	I don’t know enough to have an informed opinion about this. I feel a general skepticism after having seen a few examples of under-developed musical outputs created with AI.
104	Human touch and thought is essential for art. If it's a tool, I'm ok with it, but if it's just generating slop then it's a tragic waste of attention and an insult to everyone who ever made art.
105	It can be nice to accelerate programming tasks in music programs, research something or maybe even to get some inspiration. But in the end, its recycled material based on statistical probabilities (in case of LLMs e.g.) in terms of creative input from AI models. Yet, I think the opportunities to support the training of musicians are there. E.g. through analysis of their performance (if you have a specific goal in mind).
106	I don’t think it would help me perform any better.
108	AI has a ton of capabilities if you use it correctly and only use it for small things to help you
110	It can explore creative opportunities that might not be conceptually possible for the artists, giving new or un-found ideas, can process information quicker than humans alone.
111	Machine learning and AI models can be useful if they augment existing practices but not replace critical thinking, debugging, experimentation.
112	I do not know the answer
113	They can be very useful because there isn't an objective success metric or a well-defined problem description, despite the science.
115	time saver
116	I’m poorly informed when it comes to this topic. However, I’m intrigued.
117	I believe ML can help creators get more complex responses from their computers.
122	I don’t think they are useful because they get in the way of creativity.
148	I think there is not enough awareness about different distinctions of machine learning and AI. The majority of artists reject generative models, as it is usually against their philosophy. I would say simpler machine learning would be cool for artists, but mostly used in the sound art realm.
155	like all technologies, they give us new ways of thinking about our creative process, expanding what art is and can be
156	Exploring the differences between human and machine listening. Playing on the characteristic limitations of AI models. Different dynamics when interacting with AI than with other humans...
194	Any type of influence can lead to new creativity

204	Yes, they would be useful, as long as their use is clearly defined within the artistic workflow
207	It can make the process of getting a song published and available to the public much quicker.
208	Has potential, but 'powerful' tools tend to be either too specific in output/application, or too difficult to customize, or both. Many AI tools seem developed and intended for non-artists to use to short-circuit the artistic process. I prefer tools that I can use _within_ my process rather than in place of it.
211	they speed up the initial creative process
212	Some popular sounds are still very difficult to
214	Someone will take advantage of it in order to use less money (which means less human creativity).
216	Expanding possibilities. Discovering new aspects of oneself’s creative process.
217	It can be useful for those who can understand how it works. I don't (and am not that interested), so I don't think I would grow artistically from it.
220	I think that AI/ML models can enhance the scope of sonic expression that is possible for musicians if it is designed in a way that is interactable in real time. New technology has always been at the forefront of musical innovation and I think it is important for artists to help shape it!
