1	I have used datasets acquired online, such as economic data, for sonification purposes to drive software synthesizers
3	I make audio recordings and digital pictures and videos inspire me.
4	for inspiration
5	
6	Sample libraries.
7	I used a pretrained NeRF model and used a ZED2i stereo camera to reconstruct a 3D model of a pear with images and camera pose information. It will be put inside of my game (where the art style is pixel art so it will feel out of place). I plan to make a comedic scene using the gigantic pear in hopes of making my players laugh.
8	I recorded choral singers performing single notes of different vowels with Ambisonic microphones to create a singing vowel lexicon/sample libraries. I clustered these files with Flucoma and fed it into a RAVE autoencoder in Max/MSP.
9	Trained a finite state machine system for harmonic accompaniment generation
10	Datasets for jazz techniques on guitar
11	Finetuned transformer on a small dataset
13	data augmentation (adding noise, filtering, changing method of creating spectrogram) in instrument classification machine learning model.
14	I recorded videos of myself making gestures and also asked my friends to make gestures that I could recognize with OpenCV.
16	Train my tone Encoder and Guitar Sound Generator.
18	recordings, digital scores
20	Combination of music to enhance the setting, the “build up” based on multiple in game events
21	I have used datasets for research but not much for my own creative practice. I would try and source data for feeding into the Impro-Visor program.
23	Finding and cleaning MIDI datasets for training a MIDI generative model
24	With sound, I attempted (and failed) to train my own RAVE model based on my field recording archive. In general, I often think of my field recording archive as its own dataset, though it's one I use hands-on, not through abstraction. My most successful use of datasets in an artistic project was with a visual project, where I created a
25	Since my creative practice is typically acoustic and folk music influenced, I have not used datasets in this context.
27	I trained several neural networks on different data sets, to use with IRCAM RAVE and nn~ in Max. The first data set was from the BBC Sound Effects archive. I had downloaded this seven or eight years ago when it first released publicly on the internet. The second data set was approximately 4 hours of my own music works that I had previously released. With IRCAM RAVE and nn~, I was able to generate a model with an 8-dimensional latent space, which I live-coded to create this album: https://nnirror.bandcamp.com/album/nsendu-flash
30	I have used data sets for sleep research as well as climate change research
31	I gathered them for making a digital clone of Stam Audio SA-2A.

32	All kinds of ways: as images in part of a larger whole, as source material to manipulate through algorithms, as text to be animated by TTS models, as training data for custom models, etc.
33	Sometimes, when I am starting a project and need a bit of inspiration, I might turn to an online subscription-based service like Splice, where musicians upload sound packs that users can download and use in their compositions (without any copyright barriers). Personally, I have created my sound packs and have also compiled many of my own productions into beat packs. When it comes to visual art, I usually turn to a website like Pexels that has free-to-use images for my album/song covers.
34	No systematic work with data sets
37	I haven't used a dataset to train a model specifically for my creative process. I have played around with concatenative synthesis, also called audio mosaicing, which pulls audio samples from a corpus to try and match the harmonic and percussive events of an incoming signal. Specifically using the project from this ISMIR demo: https://www.ctralie.com/TheConcatenator/supplementary/ .
39	records of solo improvisations that were manually coded for timbre qualities
40	samples, presets, ambience audio are all datasets I have worked with
41	I usually use audio recordings to capture my ideas so then I can flesh them out in more detail later.
43	I build tables of chords and scales with imbedded information.
44	Currently, I am in the process of gathering gestures data, where participants have to do a particular gesture, and we will collect accelerometer, gyro, etc. data.
46	use data features and patterns to drive the parameters of a synth
48	never worked
49	Yes, I have worked with datasets in the creative process of antenna design for mobile applications. For example, I used simulation data (gain, bandwidth, VSWR, return loss) from HFSS to train a machine learning model that predicts optimal antenna dimensions for specific frequency bands, helping accelerate the design process.
52	(i haven't)
53	I have worked with popularity and other metadata from spotify in multiple projects. I have also used Essentia, much of which is based on Audioset from Google.
54	I created datasets with various tools and used it as part of composition, for example one where the outcome were scattered randomply in the timeline to create a first structure, as a starting point. It worked well as a method.

55	I don’t just “use” datasets—I design and shape them as compositional substrates. In my practice, datasets serve not merely as sources of content, but as axioms upon which formal transformations can occur. Whether derived from existing music, quantum outputs, sensor networks, or entirely abstracted data structures, they become the terrain over which rules, systems, and aesthetic constraints operate. In the Quantum Composition project, I use as data sets the curated corpora of a composer such as Mozart to investigate how quantum computation can model stylistic expectations and create variations. These systems are designed to explore the individual high-dimensional structures of each musical work into an expectation and then to allow the quantum processes to improvise new works that first reflect variants existing within the same stylistic space, and then to recombine or interpolate between the style spaces of other composers. Another example is the mapping of arbitrary datasets—semantic, environmental, or otherwise—into musical domains through transformational rules-based processes. Since any dataset can be made fungible by stripping it of its terms, I can test whether internal structures survive their translation into meaningful sound environments, and then refine those mappings to generate new musical works that preserve or reconfigure value-position relationships across compositional space/time. I have used complex data sources—such as DNA sequences, meteorological patterns, and financial charts—as generative material. My use of fractals in composition began during my master’s work, with tiny data sets are recursively expanded into compositions of high self-referentiality. At that time such processes required laborious, hand-calculated calculations. Those early efforts laid the groundwork for recursive and fractal expansion techniques I now deploy algorithmically, allowing compact input sets to generate large-scale, self-similar musical structures whose deviations encode formal evolution.
56	I wrote a dissertation and defended it
57	I conduct research on music cognition, so I have gathered and analyzed data on musically-relevant projects, but have never used data in my creative process.
61	At the recording studio, I frequently am asked to sample audio recordings or sound effects online.
62	Used and manipulated audio recordings to document performances and submit for review; scanned paper scores for use on a tablet; taken photos of equipment setups; digitized and reduced percussion parts for an opera in MATLAB to optimize the number of players required in the pit orchestra; accessed numerous datasets online for various uses
68	I've sampled audio recordings and pieces of media in my own work.
69	I TAed a class on machine learning but have not used datasets for my own work.
70	No in creative, yes in day job as researcher
71	Collecting sounds from sound databases
72	Training wavenets on “bad” sounds like static and noise.
73	Mostly kind of as sound banks, things to sample/process/add into the sonic mix stochastically
74	Not which I can remember.
75	digitally recorded work, digital images of my scores
76	Datasets are an interest taxonomy of a particular thing in the world—I have used a dataset that was comprised of machine sounds (fans, pumps, sliders) that were functioning well and not functioning well (intended to train a model to know when a machine was broken). This was an interesting classification of function that I played with, staking out the bounds of a ‘world’ and a spectrum between functional and non-functioning.

78	I’ve worked with both audio recordings that have either been designed as a click to play along with or another sound added to a piece.
80	I recorded and used many field recordings and audio samples. I have also done some data sonifications.
83	I wrote down a collection of numbers.
84	Gathering spectra data of stellar objects for my Timbre of Starlight instrument.
85	The score following software I use trains on takes of performances, in this sense you have to generate your own datasets (looking for rubato tendencies)
87	#REF!
88	I use a Touchdesigner library called mediapipe that uses a dataset to power an AI-bodytracking algorithm.
89	I have gathered samples which had been used in previous recordings which were then chosen randomly via drum triggers
93	Custom data tables for synthesis or algorithmic composition variables
94	Conceptualizing using EEG scans from musicians playing improvised music to visualize the importance of artists data and autonomy.
96	- have recorded (or otherwise collected) small, intentional datasets of sound with a particular sonic print, to use as material for a composition or performance.
97	I saw your definition of data above, but don't know what you mean by datasets.
99	I am an ecologist and have collected data for every research question I've asked! My datasets deal with measures of the environment and some biotic response (e.g., animal behavior, growth, physiology).
102	I have not
110	Musical sample collection; also worked with code datasets to train my agent
111	I have used the Internet Archive for recorded material to experiment with sampling techniques, YouTube videos as learning material, other audio libraries for references on field recordings of natural sounds like insects, birds, etc.
112	Used audio files as the blueprint for a written score
113	Pre-train the dataset and adjust parameters to develop a better model.
117	I recorded a bassist improvising and then recorded him again while he responded to the first take. I used samples from the first take as input and samples from subsequent takes as desired output to train a perceptron to generate responses to the bassist's performance in realtime.
118	Transforming application logs and system metrics into tones
122	For sofinication
130	I’ve cloned my voice and created a digital avatar, and used my recorded music as source material for creating ai generated music. I also helped manage product for a front end that makes it easy to fine tune an image model using Flux LORA on IP that you have the rights to use.
155	i use all my own data by analyzing recordings, videos, control data, and more

156	Training of AI models. And exploration of datasets through musical characteristics (with FluCoMa for instance)
204	I work with audio recordings, movement data, weather data (and other environmental data such as wave energy)
207	Going out into the world and recording my own audio samples to be used in my compositions.
208	sonify air quality and weather-related data. Treat musical scores as data sets to be manipulated in real time. Gather performance-related data to drive audio processing
211	used them to train ML algorithms
217	Use of public domain materials such as audio and video
