1	Environmental data, economic data, and demographic data.
3	visuals along side music
4	more acoustic instrumentation
6	I would love a jive sample pack
7	I would be interested in image datasets of common objects (with camera pose information) for photogrammetry applications and audio datasets potentially for machine learning enhanced immersion of video game music
8	Collaboration with contemporary composers to help AI models develop novel melodic and tonality systems.
9	I'm not interested in using existing datasets in the future
10	Any music data as long as it is ethically and consensually sourced (not suno or udio)
11	I would like to see real-time how
12	Sound samples of all instruments in the world
14	all types of multimodal and multisensory input and output. Sound, Touch, Temperature, Taste, Smell, Neural activity, gestures, etc.
15	Sets of sounds (e.g. for sound synthesis) or images (e.g. for recognition or generation of creative visuals)
16	Sounds from different instruments.
18	visual images and video in combination of music
20	Haptic feedback
21	I'm not sure that I would be that interested, for creative work, yet. Perhaps for trying out ideas in a new area and supporting ideation.
23	performance MIDI data of all types of music
24	I'm really interested in experimenting with high-fidelity field recordings in machine learning algorithms—I'm currently collaborating with an engineer to accomplish the above RAVE training for use in my own improvisations. I'm also planning to dive into FluCoMa soon, as I've been told it has excellent resources for dynamic slicing and reordering of sampled materials.
25	If there were a ton of labeled audio recordings with chord labels, I'd train an ML model to give me reliable chord transcriptions to new songs so people could learn songs faster and work on ear training.
27	The first thing that comes to mind is a dataset of grayscale images with intricate geometries. I have been working on an additive synthesizer that converts images into sound, and being able to interpolate between various images or come up with new ones would present some interesting possibilities.
28	Musical arrangements Recordings of specific instruments, sounds, related elements Musical progressions
30	Any day of related to a human problem could be useful to me.
31	If there were no practical limitations, I’d love to incorporate multimodal data that combines spatial audio recordings, high-resolution motion capture, and physiological data such as heart rate or brainwave activity from performers and listeners.

32	Depends on the project! Generically, I'm interested in exploring non-obvious data collected in the background that people aren't aware of, though that requires cooperation with the companies that gather that data in the first place. Perhaps the implication here is for more data collectors to provide more transparency about the data gathered, including clear mechanisms for individuals to retrieve their own data in a programmatic way.
33	Ocean acoustic data or recordings from an electromagnetic microphone.
34	-Live score generation based on real-time sound analysis -Image/graphic transformation and interpolation for A/V (reactive but not didactic)
35	audio recordings, images, sensor data, movement data,
37	One thing that interests me personally is long-form improvisation in music, things like free jazz, jam bands, or other long experimental improvisations. I would love a database of pieces like this that could be used to model these types of long decision-making processes that come from a group of musicians playing together. Since long context lengths are a problem for generative models, this could be really useful data.
38	I’m not sure
39	data to help the computer
40	the same: ambiences for video editing, drum samples and loops, presets etc
41	Not sure yet
43	Any data that relates to tradition music theory or the harmonic series. My goal is not to create music or a music style that has already been created. I am trying to create new, unheard of, music and music styles.
44	Accel, Gyro, Camera.
46	i dunno
48	#REF!
49	If there were no limitations, I would incorporate real-time user interaction data, environmental conditions, and multi-device signal performance data to design adaptive antennas that auto-tune for optimal performance in mobile applications.
51	Field recordings
52	i'd be leaning towards neural and/or movement data (or more broadly, 'body generated data' if this makes sense ... i ever had the intention)
53	If a frog had wings he wouldn't bump is ass so much.
54	Everyday sounds

55	If there were no practical limitations, I would be interested in datasets that exceed conventional sensory boundaries—multi-modal, multi-scalar phenomena like real-time neural activity across distributed human networks, gravitational wave patterns, or the behavioral oscillations of synthetic lifeforms. I am especially drawn to meta-datasets—datasets of datasets—and data with arbitrary dimensionality that permits an evolving n-space of parameters. I seek inputs that resist immediate interpretation and challenge the compositional system to function more as an epistemological engine than a translation mechanism. Ideally, the data wouldn't simply inform the work; it would co-author it, generating outputs that recursively modify their own source material and enable environments capable of change, self-replication, and evolution. The emergence of computational models, including LLMs, that can generate and manipulate their own data adds another layer of recursive elegance to this process. Somewhere in that recursive exchange, a new kind of music might emerge—one that doesn't describe a world, but invents one. This expanded definition of music, following Subotnick's conception of 'organized events in time,' invites mappings beyond sound into other sensorial and conceptual domains, enabling a compositional paradigm not bounded by auditory experience alone.
56	My own data made by recording my voice after some training with a human vocals coach
57	I think it would be interesting to use existing models of musical and harmonic information dynamics that I have used to analyze musical pieces (e.g., Marcus Pearce's IDyOM model)but in a generative way to play around with things like perceptual expectation in musical pieces in a more controlled/formulaic way.
58	Audio recordings and movement data
61	I am not extremely familiar with what the question is asking.
62	Live processing of sounds and/or motion tracking; sonification of scientific data
65	not sure
66	Data related with exotic genres like world-music, neo-jazz...
67	Maybe melodies of birdsongs
68	It would be interesting to create an instrument which is controlled by your physical position/movement data.
69	I'm not sure I would need to use datasets. I am interested in making AI driven robotics.
70	I can't picture what this would be but sounds interesting
71	Dunno. Would be project dependent
72	security programs raw data converted to audio.
73	Nature sounds/field recordings are most interesting to me :) Or non-sound data (e.g. number streams) that can be used as parameters that I don't need to control/trigger on my own
74	#REF!
75	i prefer to exist outside electronic or digital realms, but use recording and digital images to share my work with the world
76	Many different types. But I think part of the importance is that the datasets are not intended for art, but can be co-opted and re contextualized in ways that prove questions about sound and our experience of the world. If I was handed a dataset already optimized for sound/music creation, what would be the point that would be made?
77	climate change and weather data, data of fluctuating species populations

78	Create a percussion ensemble piece where there are multiple people who use AI to guide their pounce based off what the computer hears through microphones or something.
82	Not sure
83	Meteorological data, environmental data, sunlight variation, wind speed variation, humidity variation, color.
84	Would love better stellar spectral stuff to improve the Timbre of Starlight instrument. But for actual musical data I much prefer to gather my own, in the same way I prefer to gather my own samples for sample based works.
85	Animation/movement data, “finishing” steps for video production (e.g. color space matching)
87	#REF!
88	I'd have to think about this for a long time to give you an answer.
89	Vocal samples in a pool which would then be sorted via vocal timbre
91	Not sure
93	Generative videos using my own footage modulated by live audio
94	The effect of stressful environments on Black women and femmes and the psychological responses to various frequencies in relation to stress
96	- I wish I had a high quality shotgun mic and field recording rig on me at all times to record and label all of the sounds I run into in my daily life and turn them into a neatly organized dataset to train models and play with! think about how much [unique] sound data our ears process on a daily 24/7 basis — what if I could just access and zoom into (or out of) some of those sounds/sound scenes?
97	Audio and video recordings, computerized voices, photographs, possibly extracting audio from corrupted floppy discs, samples, holograms perhaps.
98	Repeating ratios of tones a la Lamont Young.
100	Making data maps of sound like heat maps, but with sound.
102	audio recordings, digital scores, photographs, images, sensor data, archives, movement data, geodata
105	Data about intonation in symphonic orchestras and how it changes depending on fatigue, the musical pieces, instrumentation, etc.
110	More holistic data about music itself, rather than treating music as note information e.g. MIDI
111	Cellular automata or other organic systems for natural sounding random decisions to create more random but less chaotic probability.
112	I do not know
113	Digital scores have the versatility to be converted into other formats.
116	Not sure
117	I would like to create a vocabulary for sounds made on tabla and train a model to detect them and subsequently recognize patterns from a live stream of sounds.
118	foot traffic patterns, drone imagery
122	Not sure

130	Long videos, lots of audio
148	Geographical data, anthropological data, data that can be used to comment on culture and environment
155	annotated (time tags, etc.) recordings of all the music i've ever made
156	Live stage data from the musicians i work with.
204	biometrics from groups of audiences
207	#REF!
208	More accurate and specific real-time performance-related data from musicians. One example is to accurately categorize sounds created using various techniques that would otherwise be hard to parse. For example, a guitarist might produce many similar sounds using dissimilar techniques: hammer-on, pull-off, harmonic, palm mute, etc.
211	professionally produced stems
212	As previously mentioned, choral and orchestral recordings.
214	Perhaps images?
216	Archives of podcasts
217	Sound libraries that I collect, reactive triggering from (improvised) performance
