1	Unfortunately the companies like OpenAI, Google, Microsoft, et al have worked very hard to ruin AI music generation. The academic tradition of music AI is far more thoughtful and intentioned than the schlock that these large companies are putting out trying to ape pop music. I like experimental artists making AI music, but I want nothing to do with these large companies and their projects.
4	Generated some for a personal project/assignment. tends to sound low quality and unfinished
6	It’s always more fun and joking
7	it was weird and surreal but then there were parts that sounded very similar to music I've listened to. There were also some other parts that wasn't really music but just a combination of random notes and with the instrumentation of different instruments it made a weird discord which I don't think a human would decide to do. (e.g. sometimes it can be part of jazz music but it can work out/it's intentional and it sort of works out but the AI-generated one I listened to was awful)
14	it's a bit glitchy and sometimes has static. Also, weird pauses.
16	Yes. The human sound will be a little different.
18	As for now, I feel difference at certain moments. I think I can distinguish them, though I have never participated in such experiments! If any proposes, I would like to participate to test myself.
20	It’s repetitive at times
21	It is becoming hard to tell if music is AI-generated or not, so perhaps I listen to it more than I realise.
23	AI generated songs are too generic and have no character
24	The only music I listen to that is AI generated is work where the generation is at the forefront of the result, creatively engaged as a core aesthetic component. This includes much of Jennifer Walshe's recent work, Holly Herndon, and Dadabots' multi-hour streams of extreme genres generated by AI. I think the more popular understanding of AI-generated music, such as is developed for streaming platforms, is aesthetically and ethically bankrupt.
27	Most of the AI-generated music on Suno, Udio disgusts me; it's the
28	Not always clear when it is and when it is not. On the whole, when listening for enjoyment I would prefer music composed by humans only
43	I only listen to my own music and that is because I need to make it better.
46	no, it's the same
48	I don't notice any change
49	Listening to AI-generated music feels structured but often lacks emotional depth. Unlike human-composed music, it can sound repetitive or mechanical, though it's impressive for background or mood settings.
52	i generated music with ai to send them as jokes to colleagues, otherwise a bit soulless from what i heard (read an article about ai generated music on spotify)-- why would i choose to listen to ai music if there's non-ai music out there to be discovered....

53	Over the past 10 years, I have listened to AI-generated music as part of my creative studies. The difference, for me, has to do with the level of involvement. With AI generated music, I'm trying to learn how to make better music, so my level of involvement is higher.
54	The early attempts to create classical music lacked pauses, so that was quite bad. Now I listen to (or make) pop songs in Suno which i not bad at all. I also listen professionaly as part of peer-reviewing with various degrees of listeninc pleasure.
55	When I listen to AI-generated music, or to music composed by humans, or co-authored by both, I inevitably return to a larger question: what does it mean for any intelligence to listen? Within the Balanced Blended Space framework, listening is a cognitive symmetry—a conceptual bridge between human and computational perception. It's not just about decoding sound, but about perceiving intention, transformation, surprise, and beauty across differing architectures of mind. For me, listening to AI-generated music differs not in depth, but in character. Human composers often embed history, memory, and emotion through embodied gesture. AI-generated music, by contrast, may surprise with its alien logic, its unfamiliar attractors, or its elegance born from patterns no human would instinctively choose. These differences are not inferiorities—they're invitations to reimagine what aesthetic meaning can be. Crucially, symmetrical listening requires us to take seriously what computational intelligences might consider meaningful. If we are to compose music that satisfies both cognitive and computational intelligences, we must investigate where our perceptions align. If we ever create works that both find
56	Utter shite. Any human created music, even the worst kinds of it, is infinitely better than AI slop.
58	Most of what I've heard so far sounds a bit
60	I listen to the ai band "the velvet sundown" that was in the news a few weeks ago for becoming popular on Spotify and it was later revealed that it was an AI band. It sounded like regular human generated music to me and I couldn't tell the difference.
62	Found on Youtube & used as background music for studying until realizing it was AI-generated; experience was largely the same without the knowledge of its origin
64	Of course! I can recognise which song tracks are Ai generated and I don't really like them!
66	It does not differ, for human ear is very difficult to recognise an AI-generated song, therefore I do not mind if some music is from an AI.
67	It can be funny but it's not serious
72	Exploring a timbral or genre of music.
74	Not applicable
77	I find myself no longer listening with an expectation or curiosity of connection with a creative human being behind the music.
81	So much of it sounds the same / generic. It's fairly prevalent on social media.
85	I listen mostly to AI meme music
87	#REF!

88	I usually listen to music live. I prefer not to know the
89	I’ve listened to a handful of ai songs which I learned about in the context of making fun of how bad or generic or odd the choices were
93	I think that some of the
95	Yes, AI music feels so impersonal. I mostly hear it on tiktok
98	It might differ in technique, but AI generated music can mimic non AI music.
99	I don't know what AI Generated music I've heard; I have not sought it out.
100	Yes generally gag music, less of a personal connection, more about humor.
102	There is a difference
108	Spongebob AI music videos on tiktok. The voices use AI but it’s different because it sounds like a computer is singing
110	It depends - both on the methods and the artist. If it is a simple text prompted system, such as Udio or Suno, without any artistic intent, then it's not interesting to me to listen to. But artists who have used AI to generate music in a way that aligns to artistic purpose, often those that work with small, custom or even no-data approaches are the most interesting to listen to as they move beyond the pastiche outputs of larger models.
113	Not very huge differences; roughly the same.
118	mostly curiosity-driven but not super impressed
194	It is usually just for a laugh. Kermit the frog singing snoop dog for example. It is very different
208	Not different
211	I do not take it as seriously
216	More inspiring.
